The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $\leq 5\%$

2 Ensemble composition and analysis (i)

This entry contains 10 models. This entry does not contain polypeptide chains, therefore identification of well-defined residues and clustering analysis are not possible. All residues are included in the validation scores.

3 Entry composition (i)

• Molecule 1 is DNA/RNA hybrid called DNA/RNA (5'-D(*GP*GP*AP*C)-R(P*(U25)P*(U25)P*(C25)P*(5GP))-D(P*GP*TP*CP*C)-3').

4 Residue-property plots (i)

4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

• Molecule 1: DNA/RNA (5'-D(*GP*GP*AP*C)-R(P*(U25)P*(U25)P*(C25)P*(5GP))-D(P*G P*TP*CP*C)-3')

61 62 64 64 64 69 69 710 710 7110 7110 7110 7110 7110 7110			

4.2 Residue scores for the representative (author defined) model from the NMR ensemble

The representative model is number 1. Colouring as in section 4.1 above.

5 Refinement protocol and experimental data overview (i)

The models were refined using the following method: *simulated annealing*.

Of the 20 calculated structures, 10 were deposited, based on the following criterion: *structures with the least restraint violations, structures with the lowest energy.*

The following table shows the software used for structure solution, optimisation and refinement.

Software name	Classification	Version
X-PLOR	refinement	3.851

No chemical shift data was provided.

6 Model quality (i)

6.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: 5GP, C5P, U5P

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with |Z| > 5 is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).

Mol	Chain	B	ond lengths	Bond angles		
		RMSZ	$\#Z{>}5$	RMSZ	#Z > 5	
1	А	1.43 ± 0.02	$1{\pm}0/179$ ($0.5{\pm}$ $0.2\%)$	2.17 ± 0.01	$13{\pm}1/272$ ($4.8{\pm}$ 0.2%)	
All	All	1.43	9/1790~(~0.5%)	2.17	131/2720~(~4.8%)	

All unique bond outliers are listed below.

Mol	Chain	Res	Type	Atoms	Ζ	$Observed(\text{\AA})$	$\mathrm{Ideal}(\mathrm{\AA})$	Moo Worst	
1	А	10	DT	C5-C7	5.39	1.53	1.50	8	9

5 of 14 unique angle outliers are listed below. They are sorted according to the Z-score of the worst occurrence in the ensemble.

There are no chirality outliers.

There are no planarity outliers.

6.2 Too-close contacts (i)

In the following table, the Non-H and H(model) columns list the number of non-hydrogen atoms and hydrogen atoms in each chain respectively. The H(added) column lists the number of hydrogen atoms added and optimized by MolProbity. The Clashes column lists the number of clashes averaged over the ensemble.

Mol	Chain	Non-H	H(model)	H(added)	Clashes
1	А	244	133	133	6 ± 2
All	All	2440	1330	1330	59

The all-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The all-atom clashscore for this structure is 16.

5 of 19 unique clashes are listed below, sorted by their clash magnitude.
