| Metric | Whole archive <br> (\#Entries) | Similar resolution <br> (\#Entries, resolution range $(\mathbf{\AA})$ ) |
| :---: | :---: | :---: |
| $\mathrm{R}_{\text {free }}$ | 130704 | $5042(2.30-2.30)$ |
| Clashscore | 141614 | $5643(2.30-2.30)$ |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments of the lower bar indicate the fraction of residues that contain outliers for $>=3,2,1$ and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $<=5 \%$ The upper red bar (where present) indicates the fraction of residues that have poor fit to the electron density. The numeric value is given above the bar.

## 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and electron density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green $=0$, yellow $=1$, orange $=2$ and red $=3$ or more. A red dot above a residue indicates a poor fit to the electron density (RSRZ $>2$ ). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

### 5.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: CU, ACT, CL, SO4

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>5$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

| Mol | Chain | Bond lengths |  | Bond angles |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

In the following table, the Atoms column lists the number of modelled atoms in the group and the number defined in the chemical component dictionary. The B-factors column lists the minimum, median, $95^{t h}$ percentile and maximum values of B factors of atoms in the group. The column labelled ' $\mathrm{Q}<0.9$ ' lists the number of atoms with occupancy less than 0.9.

[^0]:    ${ }^{1}$ Intensities estimated from amplitudes.
    ${ }^{2}$ Theoretical values of $\langle | L \mid>,\left\langle L^{2}\right\rangle$ for acentric reflections are $0.5,0.333$ respectively for untwinned datasets, and $0.375,0.2$ for perfectly twinned datasets.
