The reported resolution of this entry is 1.65 Å.

Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric                | Whole archive        | Similar resolution  |
|-----------------------|----------------------|---|
| Metric                | $(\# {\rm Entries})$ | $(\# { m Entries},  { m resolution}  { m range}({ m \AA}))$ |
| Clashscore            | 141614               | 1931 (1.66-1.66)  |

| Sidechain outliers    | 138945               | 1891 (1.66-1.66)  |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments of the lower bar indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions <=5%

Note EDS was not executed.

# 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

Note EDS was not executed.

# 5 Model quality (i)

## 5.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: ZN

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with |Z| > 5 is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

| Mol | Chain | Bond | Bond lengths |      | nd angles     |
|-----|-------|------|--------------|------|---------------|
|     | Unain | RMSZ | # Z  > 5     | RMSZ | # Z  > 5      |
| 1   | В     | 0.46 | 0/256        | 0.85 | 1/395~(0.3%)  |
| 2   | С     | 0.43 | 0/282        | 0.87 | 0/432         |
| 3   | А     | 0.43 | 0/765        | 0.64 | 0/1021        |
| All | All   | 0.44 | 0/1303       | 0.75 | 1/1848~(0.1%) |

Chiral center outliers are detected by calculating the chiral volume of a chiral center and verifying if the center is modelled as a planar moiety or with the opposite hand. A planarity outlier is detected by checking planarity of atoms in a peptide group, atoms in a mainchain group or atoms of a sidechain that are expected to be planar.

| Mol | Chain | #Chirality outliers | #Planarity outliers |
|-----|-------|---------------------|---------------------|
| 1   | В     | 0                   | 1                   |
