## 1 Overall quality at a glance (i)

The following experimental techniques were used to determine the structure: SOLUTION SCATTERING

The reported resolution of this entry is unknown.
Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | Percentile Ranks |
| :---: | :---: |
| Clashscore |  |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments of the lower bar indicate the fraction of residues that contain outliers for $>=3,2,1$ and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $<=5 \%$

Note EDS was not executed.

## 2 Entry composition (i)

There is only 1 type of molecule in this entry. The entry contains 852 atoms, of which 0 are hydrogens and 0 are deuteriums.

In the tables below, the ZeroOcc column contains the number of atoms modelled with zero occupancy, the AltConf column contains the number of residues with at least one atom in alternate conformation and the Trace column contains the number of residues modelled with at most 2 atoms.

- Molecule 1 is a protein called COMPLEMENT RECEPTOR TYPE 2 PRECURSOR,.

## 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green $=0$, yellow $=1$, orange $=2$ and red $=3$ or more. Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

Note EDS was not executed.

## 4 Model quality (i)

### 4.1 Standard geometry (i)

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>5$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

There are no protein, RNA or DNA chains available to summarize Z scores of covalent bonds and angles.

There are no bond length outliers.
There are no bond angle outliers.
There are no chirality outliers.
There are no planarity outliers.

### 4.2 Too-close contacts (i)

In the following table, the Non- H and H (model) columns list the number of non-hydrogen atoms and hydrogen atoms in the chain respectively. The H (added) column lists the number of hydrogen atoms added and optimized by MolProbity. The Clashes column lists the number of clashes within the asymmetric unit, whereas Symm-Clashes lists symmetry-related clashes.

| Mol | Chain | Non-H | H(model) | H(added) | Clashes | Symm-Clashes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | $1-\mathrm{A}$ | 142 | 0 | 0 | 1 | 0 |
| 1 | $2-\mathrm{A}$ | 142 | 0 | 0 | 1 | 0 |
| 1 | $3-\mathrm{A}$ | 142 | 0 | 0 | 3 | 0 |
| 1 | $4-\mathrm{A}$ | 142 | 0 | 0 | 5 | 0 |
| 1 | $5-\mathrm{A}$ | 142 | 0 | 0 | 3 | 0 |
| 1 | $6-A$ | 142 | 0 | 0 | 3 | 0 |
| All | All | 852 | 0 | 0 | 16 | 0 |

The all-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The all-atom clashscore for this structure is 19 .
All (16) close contacts within the same asymmetric unit are listed below, sorted by their clash magnitude.

| Atom-1 | Atom-2 | Interatomic <br> distance $(\AA)$ | Clash <br> overlap $(\AA)$ |
