Data quality ?

Scattering profile ?

SAS data used in this integrative model was obtained from 1 deposited SASBDB entry (entries).

Scattering profile for [SASDEE2](#): data from solutions of biological macromolecules are presented as both log I(q) vs q and log I(q) vs log (q) based on [SAS validation task force \(SASvtf\) recommendations](#). I(q) is the intensity (in arbitrary units) and

q is the modulus of the scattering vector.

Molecular weight (MW) estimates from experiments and analysis true molecular weight can be compared to the Porod estimate from scattering profiles.

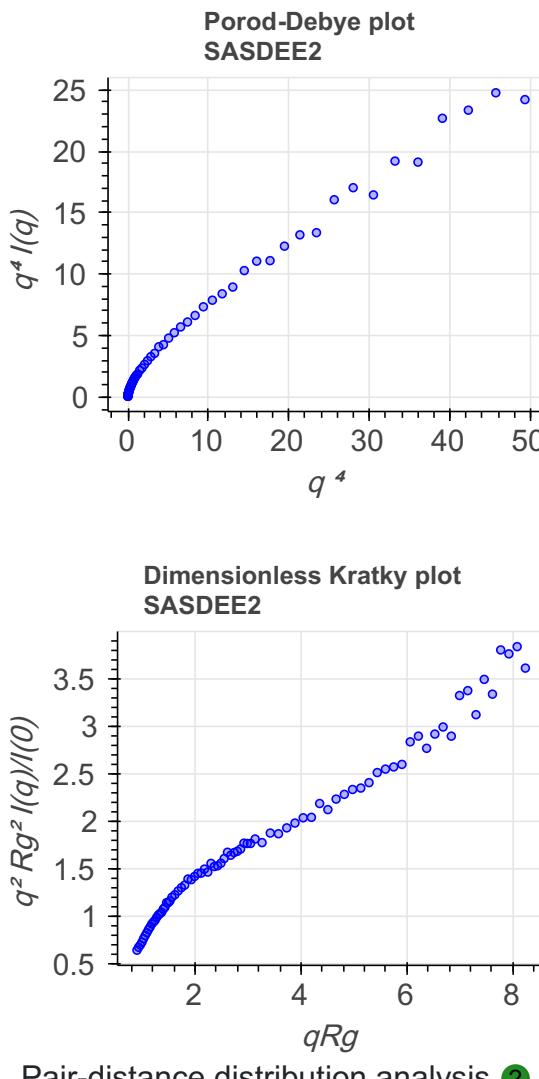

SASDB ID	Chemical composition MW	Standard MW	Porod Volume/MW
SASDEE2	20.2 kDa	N/A	N/A

Volume estimates from experiments and analysis: estimated volume can be compared to Porod volume obtained from scattering profiles.

SASDB ID	Estimated Volume	Porod Volume	Specific Volume	Sample Contrast	Sample Concentration
SASDEE2	N/A	N/A	N/A	N/A	2.50 mg/mL

Flexibility analysis ?

Flexibility analysis for SASDEE2: In a Porod-Debye plot, a clear plateau is observed for globular (partial or fully folded) domains, whereas, fully unfolded domains are devoid of any discernable plateau. For details, refer to Figure 5 in [Rambo and Tainer, 2011](#). In a Kratky plot, a parabolic shape is observed for globular (partial or fully folded) domains and a hyperbolic shape is observed for fully unfolded domains.

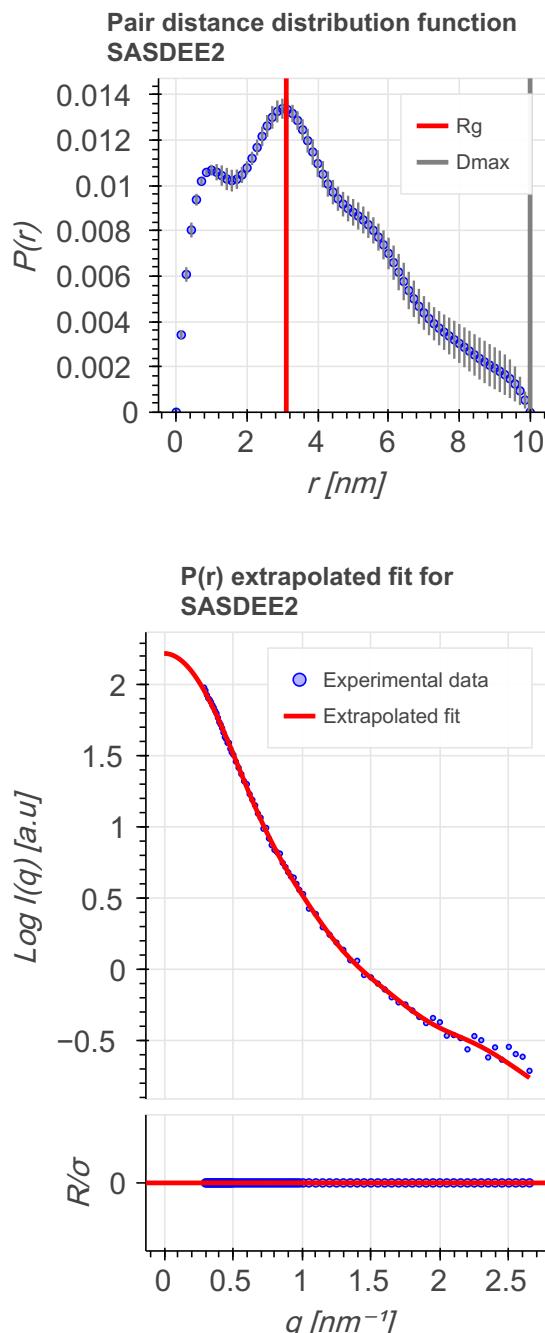

Pair-distance distribution analysis ?

P(r) analysis: P(r) represents the distribution of distances between all pairs of atoms within the particle weighted by the respective electron densities. P(r) is the Fourier transform of I(s) (and vice versa). R_g can be estimated from integrating the P(r) function. Agreement between the P(r) and Guinier-determined R_g (table below) is a good measure of the self-consistency of the SAS profile. R_g is a measure for the overall size of a macromolecule; e.g. a protein with a smaller R_g is more compact than a protein with a larger R_g , provided both have the same molecular weight (MW). The point where P(r) is decaying to zero is called D_{max} and represents the maximum size of the particle.

SASDB ID	Software used	Dmax	Dmax error	Rg	Rg error
SASDEE2	GNOM 4.6	10.000 nm	N/A	3.110 nm	N/A

P(r) for SASDEE2: The value of P(r) should be zero beyond $r=D_{max}$.

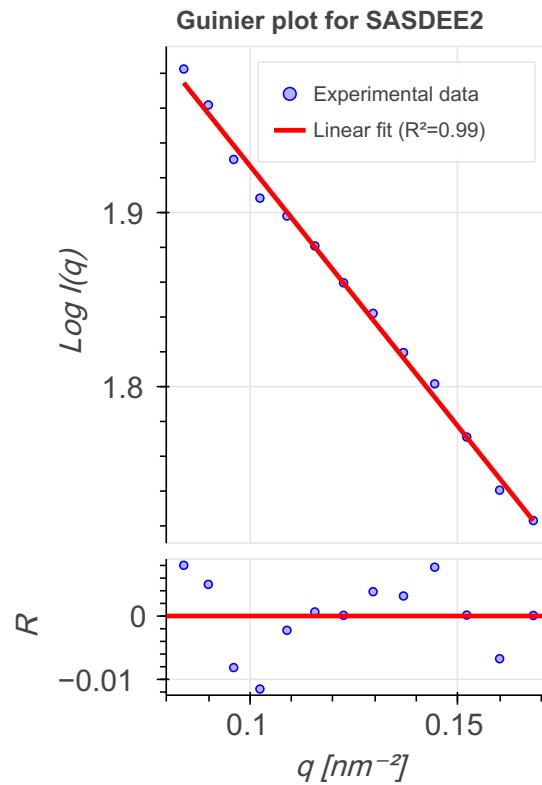

Guinier analysis ?

Guinier analysis: agreement between the $P(r)$ and Guinier-determined R_g (table below) is a good measure of the self-consistency of the SAS profile. Molecular weight estimates can also be compared to Porod and sample molecular weights for consistency.

SASDB ID	R_g	R_g error	MW	MW error
SASDEE2	3.00 nm	0.16 nm	N/A	N/A

Guinier analysis for SASDEE2: the linearity of the Guinier plot is a sensitive indicator of the quality of the experimental SAS data; a linear Guinier plot is a necessary but not sufficient demonstration that a solution contains monodisperse particles of the same size. Deviations from linearity usually point to strong interference effects, polydispersity of the

samples or improper background subtraction. Residual value plot and coefficient of determination (R^2) are measures to assess linear fit to the data. A perfect fit has an R^2 value of 1. Residual values should be equally and randomly spaced around the horizontal axis.

Model quality ?

For models with atomic structures, molprobity analysis is performed. For models with coarse-grained or multi-scale structures, excluded volume analysis is performed.

Too-close contacts [?](#)

The following all-atom clashscore is based on a MolProbity analysis. All-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The table below contains clashscores for all the models in this entry.

Model ID	Clash score	Number of clashes
1	0.00	0
2	0.00	0
3	0.00	0

9	0.00	0
10	0.00	0

All 0 close contacts within the same asymmetric unit are listed below, sorted by their clash magnitude.

Fit of model to data used for modeling ?

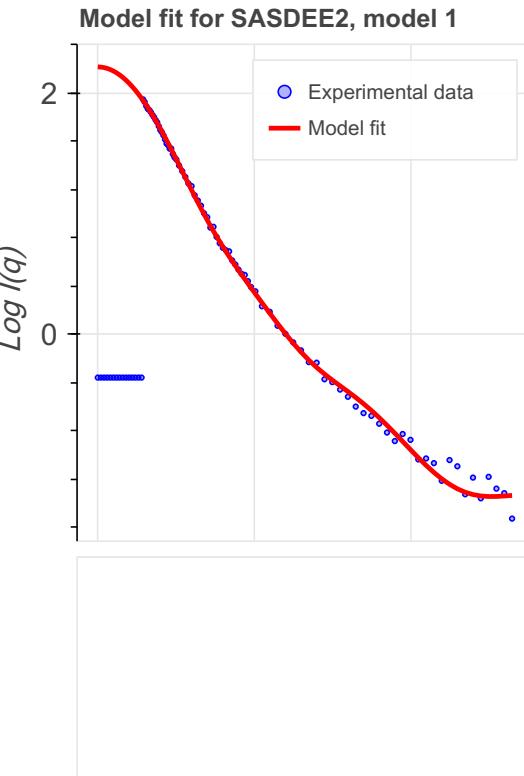

Fit of model(s) to SAS data

χ^2 goodness of fit and cormap analysis ?

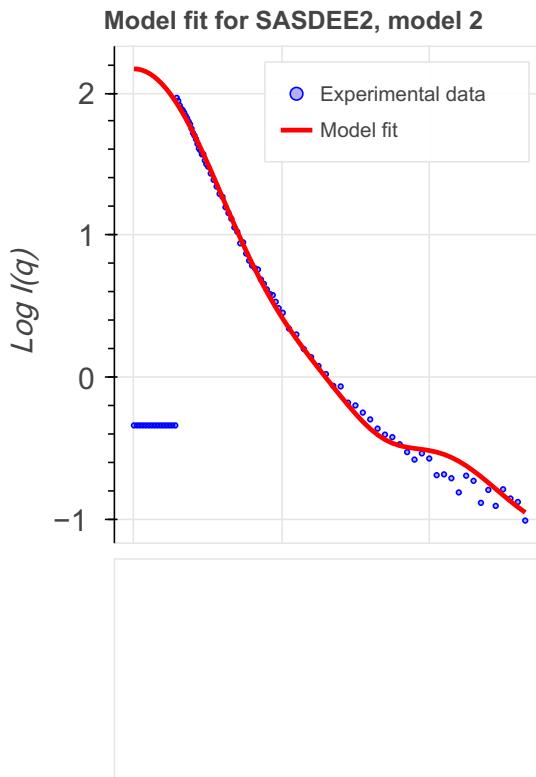

Model and fits displayed below were obtained from SASBDB. χ^2 values are a measure of fit of the model to data. A perfect fit has a χ^2 value of 1.0. ATSAS datcmp was used for hypothesis testing. All data sets are similar (i.e. the fit and the data collected) is the null hypothesis. p-value is a measure of evidence against the null hypothesis, smaller the value, the stronger the evidence that you should reject the null hypothesis.

SASDB ID	Model	χ^2	p-value
SASDEE2	1	0.14	2.50E-03
SASDEE2	2	0.34	2.50E-03
SASDEE2	3	0.51	2.50E-03

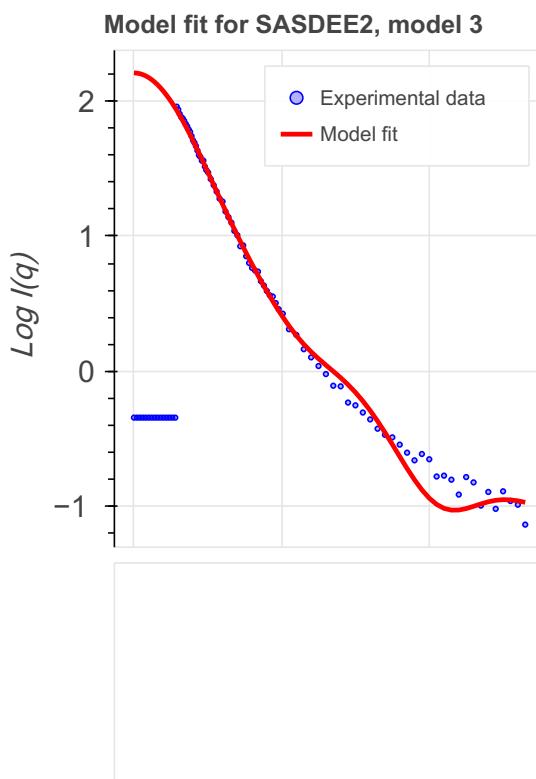

Model fit for SASDEE2 (fit/model number 1): Residual value plot is a measure to assess fit to the data. Residual values should be equally and randomly spaced around the horizontal axis.

Model fit for SASDEE2 (fit/model number 2): Residual value plot is a measure to assess fit to the data. Residual values should be equally and randomly spaced around the horizontal axis.

Model fit for SASDEE2 (fit/model number 3): Residual value plot is a measure to assess fit to the data. Residual values should be equally and randomly spaced around the horizontal axis.

Fit of model to data used for validation ?

Validation for this section is under development.
